Figure 1 consists of two panels, (a) and (b), each showing a scatter plot of the number of correct responses (Y-axis) versus the number of trials (X-axis). Panel (a) shows a positive linear relationship, with the number of correct responses increasing as the number of trials increases. Panel (b) shows a negative linear relationship, with the number of correct responses decreasing as the number of trials increases.

Figure 1 consists of two line graphs. The left graph, titled 'No feedback', shows the percentage of correct responses for a group that did not receive feedback. The right graph, titled 'With feedback', shows the percentage of correct responses for a group that did receive feedback. Both graphs plot 'Percentage of correct responses' on the y-axis (0 to 100) against 'Trial' on the x-axis (1 to 10). In the 'No feedback' graph, the performance starts around 60% and fluctuates, ending near 70%. In the 'With feedback' graph, the performance starts around 70% and shows a more consistent upward trend, reaching nearly 90% by trial 10.

Age Group	Percentage of Respondents
18-29	65
30-49	75
50-69	80
70+	85
